6.1	LABOUR PLACES .....	22
6.2	Business value.....	22
7	Interest from electricity stakeholders .....	25
7.1	Structure of the electricity system .....	25
7.2	Interest from electricity utility businesses .....	25
7.3	Interest from municipalities and local governments .....	25
8	Standards and codes .....	26
9	Highlights and prospects .....	26
	Definitions, Symbols and Abbreviations.....	27

## Foreword

The International Energy Agency (IEA), founded in November 1974, is an autonomous body within the framework of the Organisation for Economic Co-operation and Development (OECD) which carries out a comprehensive programme of energy co-operation among its 23 member countries. The European Commission also participates in the work of the Agency.

The IEA Photovoltaic Power Systems Programme (IEA-PVPS) is one of the collaborative R & D agreements established within the IEA and, since 1993, its participants have been conducting a variety of joint projects in the applications of photovoltaic conversion of solar energy into electricity.

The 24 participating countries are Australia (AUS), Austria (AUT), Belgium (BEL), Canada (CAN), China (CHN), Denmark (DNK), France (FRA), Germany (DEU), Israel (ISR), Italy (ITA), Japan (JPN), Korea (KOR), Malaysia (MYS), Mexico (MEX), the Netherlands (NLD), Norway (NOR), Portugal (PRT), Spain (ESP), Sweden (SWE), Switzerland (CHE), Thailand (THA), Turkey (TUR), the United Kingdom (GBR) and the United States of America (USA). The European Commission, the European Photovoltaic Industry Association, the US Solar Electric Power Association, the US Solar Energy Industries Association and the Copper Alliance are also members.

The overall programme is headed by an Executive Committee composed of one representative from each participating country or organization, while the management of individual Tasks (research projects / activity areas) is the responsibility of Operating Agents. Information about the active and completed tasks can be found on the IEA-PVPS website [www.iea-pvps.org](http://www.iea-pvps.org)

## Introduction

The objective of Task 1 of the IEA Photovoltaic Power Systems Programme is to promote and facilitate the exchange and dissemination of information on the technical, economic, environmental and social aspects of PV power systems. Task 1 activities support the broader PVPS objectives: to contribute to cost reduction of PV power applications, to increase awareness of the potential and value of PV power systems, to foster the removal of both technical and non-technical barriers and to enhance technology co-operation. An important deliverable of Task 1 is the annual *“Trends in photovoltaic applications”* report. In parallel, National Survey Reports are produced annually by each Task 1 participant. This document is the country National Survey Report for the year 2013. Information from this document will be used as input to the annual Trends in photovoltaic applications report.

The PVPS website [www.iea-pvps.org](http://www.iea-pvps.org) also plays an important role in disseminating information arising from the programme, including national information.

## 1 INSTALLATION DATA

The PV power system market is defined as the market of all nationally installed (terrestrial) PV applications with a PV capacity of 40 W or more. A PV system consists of modules, inverters, batteries and all installation and control components for modules, inverters and batteries. Other applications such as small mobile devices are not considered in this report.

For the purposes of this report, **PV installations are included in the 2013 statistics if the PV modules were installed and connected to the grid between 1 January and 31 December 2013, although commissioning may have taken place at a later date.**

### 1.1 Applications for Photovoltaics

Supported by various promotion mechanisms of the federal provinces and the federal government the absolute highest market diffusion of photovoltaic (PV) systems could be reached in 2013. As a result grid-connected plants with a total capacity of 262,621 kWp were installed. As during the previous years, the off-grid sector plays a minor role in the Austrian PV market (off-grid PV-capacity installed in 2013: 468 kWp). Data about market segments (residential, commercial) is not available.

### 1.2 Total photovoltaic power installed

The domestic PV system market in 2013 showed a significant increase compared to 2012. In 2013, off-grid and grid connected PV systems with a total PV power of 263,089 kWp have been installed, which represents a 49.73 % growth of the domestic market compared to the year before. This led to a cumulated total installed capacity of 625,974 kWp at the end of 2013. On a 10 years basis, an average market growth of 44.85 % per year for all PV installations can be reported.

As a consequence the estimated renewable electricity produced by PV amounted to 626 GWh in 2013 (~ 1.1 % of the total electricity consumption in Austria) and lead to a reduction in CO<sub>2</sub> emissions by 227,416 tons (emission coefficient 2013: 363.3 gCO<sub>2</sub>-equ/kWh).

Table 1 shows the PV power for grid-connected and off-grid systems installed during 2013.

**Table 1: PV power installed during calendar year 2013**

			MW installed in 2013 - AC value	MW installed in 2013 - DC value
<b>Grid-connected</b>	BAPV	Residential	262.621	
		Commercial		
		Industrial		
		<i>Total BAPV</i>		
	BIPV	Residential

## 2 POLICY FRAMEWORK

### 2.1 Direct support policies

**Table 6: PV support measures (summary table)**

	On-going measures	Measures that commenced during 2013
Feed-in tariffs	on national level via the Green Electricity Act	-
Capital subsidies for equipment or total cost	on national level by the Austrian Climate and Energy Fund and in selected provinces	short-term initiatives in selected provinces
Green electricity schemes	various	-
PV-specific green electricity schemes	UZ46, green electricity scheme established on the national level	-
Renewable portfolio standards (RPS)	-	-
PV requirement in RPS	-	-
Investment funds for PV	-	-
Income tax credits	-	-
Prosumers' incentives (self-consumption, net-metering, net-billing,...)	Selected DNOs	-
Commercial bank activities e.g. green mortgages promoting PV	-	-
Activities of electricity utility businesses	-	-
Sustainable building requirements	-	-

### 2.2 Direct Support measures

#### 2.2.1 Support measures existing in 2013

##### 2.2.1.1 Description of support measures excluding prosumers, BIPV, and rural electrification

Until today public support schemes for PV in Austria have been mainly characterized by discontinuity. The public support schemes are more or less continuously under discussion and experience a yearly change, which allows private users and investors only short time planning. The total available budget for supporting PV systems, especially for PV systems above 5 kWp, generally addresses only a small amount of the huge number of prospective buyers of PV systems in Austria. Because of the fact that no public body finances the feed-in tariff system, all electricity consumers have to come up with coverage.

Austria has mainly three levels of supporting PV systems:

Systems up to 5 kWp are supported by the also limited sources of the governmental Austrian Climate and Energy Fund, which provided a limited incentive in form of a non-refundable rebate for new installations for private households up to 5 kWp. This support scheme provides additional financial benefits to building integrated systems (BIPV). This public initiative launched once a year, was opened for the first time in August 2008 by one tender with a total budget of about 8 MEUR. In 2009, the budget was more than doubled to 18 MEUR. In 2010 the support per kWp installation was

reduced significantly according to the lower PV prices. For the year 2011 the budget remained the same as in 2010 (35 MEUR) and for 2012 the budget has been reduced to 25.5 MEUR. In 2013 36 MEUR were provided. In 2013 the investment subsidy of 800 EUR/kWp was reduced to 300 EUR/kWp or to 400 kWp for Building integrated PV systems. For the first time more money was available in 2013, that was required from buyers of PV systems. In 2013 PV systems with a total capacity of 67,867 kWp have been installed under this funding scheme, more than ever before.

For PV systems above 5 kWp a Feed-in Tariff is provided via the national Green Electricity Act (GEA), first issued in 2002, and meanwhile revised several times. Even though the “new RES” are supported by this act, mainly via up to 13 years guaranteed feed-in tariffs, the financial cap (current regulation: new PV-installations leading to another expenses of 8 MEUR per year) is low. The feed in tariffs are stated by the Federal Ministry for Economics and financed by a supplementary charge on the net price and a fixed price purchase obligation for electricity dealers. A significant change of the public support for PV installations (in order to match leading photovoltaic markets) as well as for other “new renewables” (Austria has about 60 % electricity from large hydro power plants) will also most probably not be achieved within the upcoming year. Photovoltaic-Feed-in-tariffs for new installations are defined on a yearly basis in a separate Feed-in Decree. According to the 2013 Feed-in Decree tariffs ranged from 18.12 Cent/kWh for systems above 5 to 500 kWp installed on buildings or noise protection walls down to 16.59 Cent/kWh for systems installed in an open area. In addition to the feed-in Tariff a unique investment subsidy of max. 200 EUR/kWp is granted for systems installed on buildings or noise protection walls.

**Table 7: Feed-in tariffs from 2008 to 2013 according to the Feed-in Decree**

	2008 (Cent / kWh)	2009 (Cent / kWh)	2010 (Cent / kWh)	2011 (Cent / kWh)	2012 (Cent / kWh)	2013 (Cent / kWh)
up to 5 kWpeak	45.99	45.98	-	-	-	-
above 5 kWpeak up to 10 (20) kWpeak	39.99	39.98	35 – 38	35 – 38	23 – 27.6	
above 10 (20) kWpeak	29.99	29.98	25 – 33	25 – 33	19 – 25	
above 5 kWpeak up to 500 kWpeak						16.59 – 18.12

The total amount of feed-in tariffs paid for PV in 2013 was approximately 61.7 MEUR (2012: 36.8 MEUR), which represents a 67.6 % increase compared to the previous year. The average feed-in tariff paid for PV in 2013 was 28.67 Eurocent/kWh which represents a 21.1 % reduction compared to the previous year (2012: 36.34 Eurocent /kWh).

In addition to the federal incentives almost all provinces continued running their regional support in form of rebates on the costs of the PV system (investment subsidies) in 2013. Burgenland, Salzburg, Styria and Vienna offer such a separate support scheme for PV. Other provinces (Carinthia, Lower Austria, Upper Austria, Styria and Salzburg) offer additional funding by the “Wohnbauförderung” (subsidized housing scheme). Although some subsidy schemes exclude each other, whereas others do not, this situation shows the complex nature of the incentives and the data provided. By this standard only a rough estimate for the total funds spent by the provinces can be provided.

#### 2.2.1.2 Prosumers’ development measures

In general self-consumption of PV electricity is allowed in Austria, except for PV systems which receive a Feed-In tariff by the national GEA. Until 2013 self-consumption was not charged with a tax,

but in March 2014 the Ministry of Finance announced, that self-consumption of PV electricity over 5,000 kWh per year will be charged with 1.5 Cent/kWh in the future. This tax is not new, but still exists since 1996. The exact details of this tax on self-consumption are under discussion at the moment.

#### *2.2.1.3 BIPV development measures*

Building integrated PV systems up to 5 kWp are supported by the Austrian Climate and Energy Fund, which provides an additional investment subsidy of 100 EUR/kWp (400 EUR/kWp for BIPV instead of 300 EUR/kWp). Some provinces offer higher subsidies from the “Wohnbauförderung” (subsidized housing scheme) if a PV system is installed.

#### *2.2.1.4 Rural electrification measures*

The Austrian Federal Ministry of Agriculture, Forestry, Environment and Water Management supports renewable energy systems (e.g. PV, wind power, storages, etc.) in areas not connected to the grid with an investment subsidy up to a maximum of 35 % of the eligible costs.

#### *2.2.1.5 Other measures including decentralized storage and demand response measures*

Since January 2014 decentralized electricity storages in combination with PV systems are supported in the province Salzburg. A limited incentive of 800 EUR/kWh in form of a non-refundable rebate is granted for energy storages up to 5 kWh. The total budget for 2013 is 200,000 EUR.

### **2.2.2 Support measures phased out in 2013**

In 2013 the provinces Tirol and Vorarlberg stopped their regional support in form of rebates on the costs of the PV.

### **2.2.3 New support measures implemented in 2013**

Once more the Feed-In Tariff was revised in 2013. According to the latest Feed-in Decree tariffs for 2014 ranged from 12.50 Cent/kWh for systems above 5 to 350 kWp installed on buildings or noise protection walls down to 10.00 Cent/kWh for systems installed in an open area.

In April 2014 the Climate and Energy Funds announced, that also in 2014 PV systems up to 5 kWp will be supported with an reduced investment subsidy of 275 Cent/kWp (375 Cent/kWp for BIPV).

### **2.2.4 Measures currently discussed but not implemented yet**

-

## **2.3 Indirect policy issues**

### **2.3.1 International policies affecting the use of PV Power Systems**

The promotion of electricity from renewable energy sources (RES) is a high European Union (EU) priority for several reasons, including the security and diversification of energy supply, environmental protection and social and economic cohesion.

The 20/20/20 climate and energy targets, set in 2007 by the European Union, have strong influence on Austria. Austria's targets are a total share of the national energy consumption produced from renewable resources to 34 %, a reduction in greenhouse gas emissions of 16 % below 2005 levels emissions in non-ETS sectors and an increase in energy efficiency by 20 % by 2020 as opposed to a business-as-usual scenario.

### **2.3.2 The introduction of any favourable environmental regulations**

In the city of Vienna, the local building code foresees the need to install 1kWp of PV per 100 m<sup>2</sup> gross floor area at all new industrial and commercial buildings.

### **2.3.3 Policies relating to externalities of conventional energy**

No relevant policies existing.

### **2.3.4 Taxes on pollution (e.g. carbon tax)**

In Austria the tax on new cars depends on CO<sub>2</sub> pollution-categories.

### **2.3.5 National policies and programmes to promote the use of PV in foreign non-IEA countries**

The Austrian Development Agency (ADA) has co-financed the Caribbean Renewable Energy Development Programme (CREDP) since 2009 and has directly financed investment projects such as the photovoltaic (PV) system at Guyana Energy Agency's (GEA), the PV system at Comision Nacional de Energia in the Dominican Republic, PV-lab Equipment for the Technical Community College in Saint Vincent and the Grenadines, as well as currently on-going projects such as solar water heating at St. Jude's hospital in St. Lucia, PV-LED street lighting in Saint Vincent and the Grenadines, PV system for Government Offices in Antigua and PV-lab equipment for T. A. Marryshow Community College in Granada.

The Austrian Development Cooperation (ADC) supported the establishment of ECREEE since its beginning with the creation of a secretariat in Cape Verde and a network of National Focal Institutions in all 15 ECOWAS member states. ADC will continue to support ECREEE with a core funding to its Business Plan 2011-2016 and the secondment of a technical assistant to ECREEE's secretariat in Cape Verde.

### 3 HIGHLIGHTS OF R&D

#### 3.1 Highlights of R&D

For many years, the Austrian PV research activities have mostly been focused on national and international projects: The involved research organisations and companies are participating in various national and European projects as well as in different tasks of the IEA-PVPS Programme and, concerning grid interconnection of renewables, in the IEA ISGAN Implementing Agreement (with Austria joining in 2011). The RTD development approach is widely spread and orientated in a decentralised fashion.

The trend of involvement of Austrian electricity companies investing more and more in renewable power generation has been continued. Sometimes specific departments were founded to establish a business, mainly by investments in new and existing renewable energy plants; due to the insufficient national support for renewables, they frequently invest in other European countries.

PV and the high penetration in some parts of the low voltage network become more and more important drivers for the comprehensive and internationally orientated “Smart Grid” activities in Austria, which are coordinated and supported by the Ministry of Transport, Innovation and Technology. The international “Smart Grids Week” is meanwhile established as one of the main international Smart Grid Events, taking place in different locations in Austria, each time hosted by another utility company.

In addition, the following paragraphs highlight some of the specific PV RTD activities and trends in Austria:

The **Institute of Chemistry and Technology of Materials of the Graz University of Technology** investigates new active materials for solution based PV-technologies. Examples are new organic solar cells, nanocrystal-polymer hybrid solar cells and kesterites.

The **AIT Austrian Institute of Technology GmbH**, Energy Department focuses on the strategic research fields “Electrical Infrastructure” and “Energy for the Built Environment.” The integration of PV into Smart Electricity Networks is in the centre of research efforts in the field of distributed energy resources (DER). Low and high voltage technology, power quality, safety and reliability analysis are investigated. Further, AIT Energy runs a fully-fledged Photovoltaic Module Test Laboratory, accredited according to EN 17025, for R&D on crystalline and thin-film modules. With this background, research focuses on new PV technologies, advanced experimental investigation, characterisation and modelling of PV modules, cells and systems, as e.g. facility assessment and quality measures for big PV facilities. Regarding PV performance, the simulation of system output and life cycle testing as well as building integrated PV systems (BIPV) are addressed. For the analysis of ageing and failure detection, quantified electroluminescence measurement is available for PV cells and modules of all technologies (crystalline and thin film) as well as the spectrometer radiation measurement in the range of ultra violet, visible light and infrared. On a European level, AIT Energy is participating in the DERlab Network of Excellence, which will become a key partner in the Smart Grid International Research Facility Network (SIRFN). It is involved in large-scale projects like METAPV and EcoGRID as well as in the EU projects DERri (Distributed Energy Resources Infrastructure) and SOPHIA (Photovoltaic European Research Infrastructure), offering access to its research infrastructures in the areas PV, inverter and power technologies. Within the European Energy Research Alliance (EERA) the AIT contributes to develop next-generation energy technologies. On an international level, AIT Energy is engaged in standardisation development for distributed generation and PV systems. It takes part in several IEA PVPS activities, such as Task 13 (Performance and Reliability of Photovoltaic Systems), and holds the lead in Task 14 (High Penetration of PV Systems in Electricity Grids). Further it is partner in the IEA-SHC Task 51 and Task 53.

**Vienna University of Technology, Energy Economics Group (EEG)** are covering major topics of teaching and research on Photovoltaics: diffusion of technology and market penetration on national and international level, technology roadmapping and monitoring, non-technical obstacles and supporting factors for diffusion of technology (e.g. socio-economic impact parameters), energy policy design and political economy effects of PV, energy payback time and CO<sub>2</sub> avoidance costs, PV integration in buildings as well as medium and long term diffusion scenarios of PV.

At the ENERGYBase, one the largest passive solar office building in Austria, the **University of Applied Sciences Technikum Wien** offers Bachelor and Master programmes with a strong focus on PV and other solar technologies. Research at the **Department for Renewable Energy** is focused on PV strategies as well as on system and building integration. Currently the most promising research project in this sector is SOLARROK. By SOLARROK the leading European Solar Energy Clusters develop a Joint Action Plan for the future of the Photovoltaic in Europe. The objective of SOLARROK is to strengthen competitiveness and to foster industrial innovation in the Photovoltaic sector. SOLARROK is jointly elaborated by leading clusters in Spain, France, Germany, Belgium and the Netherlands, Lithuania and Austria, plus industry and research partners in Slovenia and Norway. Austria is represented by the Department of Renewable Energy at the University of Applied Sciences Technikum Vienna. Since 2013 the Department for Renewable Energy also takes part in the IEA PVPS Task 12 (PV Environmental Health and Safety).

The research activities of **Austria Solar Innovation Center (ASIC)** are in the field of data evaluation of PV-power plant as well as the development of fault detection systems for inverters. Besides this, ASIc offers consultation for PV as well as teaching and training in collaboration with the Upper Austria University of Applied Sciences, degree programme Eco-Energy Engineering (BSc, MSc). Students have lectures and laboratory classes, where also the 17 kWp PV system - 5 different module types, 5 different inverter types, 2 monitoring/data logging systems, meteorological station - is used for practical training.

The **Institute of Polymeric Materials and Testing (IPMT)** at the **Johannes Kepler University Linz (JKU)** was established in 09/2009 and has now completed its first phase of laboratory investments, thus achieving full operation capability. Key individuals of the IPMT have a broad experience in the field of plastics for solar applications and expertise and know-how related to coordination and management of large research projects. In 2010, the JKU with the IPMT started a Project entitled "Solar-electrical Systems based on Polymeric Materials: Novel Polymeric Encapsulation Materials for PV Modules".

The **Polymer Competence Center Leoben (PCCL)** is working in the field of polymeric encapsulation materials for solar cell and PV module encapsulation. Since 2003 the main focus of the research was set on durability testing, lifetime modelling and aging characterization of polymeric materials and components as well as the evaluation and qualification of new materials for PV encapsulation. A newly installed research focus is the establishment of correlations between material properties, processing parameters and PV module failure.

**CTR Carinthian Tech Research AG** is an industry-oriented research and development centre for smart sensors. CTR is also a COMET K1 Centre of Excellence for smart sensors and develops PV modules, tests them and manages projects together with manufacturers in an attempt to improve the technology's efficiency along the entire value chain. In-depth investigations using state-of-the-art laboratory equipment and an outdoor test facility for measurements under real environmental conditions enable us to analyse weaknesses and develop troubleshooting concepts.

### 3.2 Public budgets for market stimulation, demonstration / field test programmes and R&D

The major institutions dealing with research and development policy are the Federal Ministry of Transport, Innovation and Technology (BMVIT) and the Austrian Climate and Energy Fund (KLIEN). These are the major organizer and facilitator for public R&D activities in Austria. The majority of public R&D programmes operate under these institutions and there are several programmes, which focus on energy-related fields. There is no programme specifically dedicated to PV R&D, but the topic is mainly funded within the framework of the energy R&D programmes.

Two national programmes, “e!MISSION.at” by the Austrian Climate and Energy Fund, as well as “City of Tomorrow” by the Ministry of Transport, Innovation and Technology cover broad research items on energy technologies including a specific PV focus. “e!MISSION.at” follows in the footsteps of its predecessor “New Energies 2020” to further the goal of more research in the areas cost reduction of clean power and highly efficient technologies. Both programmes connect science and economy on a profitable level with a focus on scientific breakthroughs and sustainable product placement in the market. It is important to provide Austrian companies with the possibility to thrive in this very important sector also on a transnational level. Thus, Austria participates in SOLAR-ERA.NET „Solar Electricity for the Implementation of the Solar Europe Industry Initiative”.

The total amount of energy related research funding indicated for the year 2013 was 124,5 MEUR (2012: 120 MEUR, 2011: 121 MEUR). In 2013 renewable energy received about 29.5 MEUR (23.67 %) of the Austrian Energy R&D, compared to 28.2 MEUR (23.5 %) in 2012. The area of energy efficiency received 44.61 % (2012: 46.13 %). These two areas clearly show the priority of the publicly financed energy research in Austria. About 1,100 R&D projects and activities were registered and analysed for the year 2013 (2012: 1,000). In 2013 the overall public spending for PV research and development was about 11.1 MEUR (2012: 7.4 MEUR).<sup>2 3</sup>

Not included in these figures is the return from European Community (EC) R&D projects. As a member of the European Union, Austria contributes to the EC R&D framework programmes (FP), hence the return can be ultimately regarded as a part of public spending.

There are no specific figures available for the share of Demonstration or Field Test activities but as there was no demonstration or field test programme running in 2012 and 2013.

The total governmental budget allocated for PV R&D and Demonstration is shown in Table 8.

**Table 8: Public budgets for PV R&D and demonstration/field test programmes.**

	R & D	Demo/Field test
National/federal	11.1 MEUR (2013) 7.4 MEUR (2012)	N/A
State/regional	N/A	N/A
Total	11.1 MEUR (2013) 7.4 MEUR (2012)	

<sup>2</sup> Andreas Indinger, Marion Katzenschlager (2013) Energieforschungserhebung 2012 – Ausgaben der öffentlichen Hand in Österreich. BMVIT Schriftenreihe 38/2013

<sup>3</sup> Andreas Indinger, Marion Katzenschlager (2014) Energieforschungserhebung 2013 – Ausgaben der öffentlichen Hand in Österreich. BMVIT Schriftenreihe 27/2014

## 4 INDUSTRY

### 4.1 Production of feedstocks, ingots and wafers (crystalline silicon industry)

No production facilities for silicon feedstock or wafers existed in Austria in 2013.

However there is substantial production of photovoltaic thin film components. The company **Plansee High Performance Materials** – headquartered in Tyrol - manufactures components made of refractory metals and metallic composite materials. For the production of back contacts and absorber layers in CIGS solar cells the company supplies high quality sputtering targets. Sputtered layers are highly reflective and conductive and are therefore used for increasing the efficiency on solar panels. The material portfolio includes: molybdenum, tungsten, copper, aluminium, CuGa, CuInGa, and new alloys such as molybdenum-sodium and corrosion resistant molybdenum-tantalum.

### 4.2 Production of photovoltaic cells and modules (including TF and CPV)

Compared to the increase of the installed capacity in 2013 the Austrian PV industry wasn't able to keep pace in terms of production. In total, Austrian module manufacturers had to register only a small increase in their production compared to the previous year. The total module production in 2013 amounted to 74.5 MWp. Compared to 70.9 MWp in 2012 this figure represents an increase of 5.1 % (see **Figure 1**). About 44 MWp of this production volume was sold to Austrian companies, which represents an increase of 104.3 %. At the same time, the export rate of Austrian modules decreased by 38.7 % from 48.5 MWp in 2012 to 29.7 MWp in 2013. For the first time the home market became more important for Austrian module manufacturer than the export market

**Figure 1: Development of PV module production in Austria since 2003; Data source /graph: Technikum Wien/AIT**

Currently the following Austrian companies are involved in the production of PV-modules, namely:

**Kioto-Photovoltaic**, since 2004 produces mono- and multi-crystalline solar modules based on 6" wafers in St.Veit/Carinthia.

Although present in PV market as a contractor from 1995, **Energetica Energietechnik GmbH** has been producing PV modules since 2004 at its own production facility. The core competences are the production of PV-modules but Energetica also acts as a system provider and project contractor on a global scale.

**Ertex Solartechnik GmbH** realized approximately 700 BIPV projects in the past 9 years. Their main product is the laminated safety glass module (VSG), which can be also easily assembled to insulating glass. In 2012, ertex solar got the approval for the German DIBt (Deutsches Institut für Bautechnik) and also the microgeneration certification scheme MCS 017 for BBIPV solutions on the UK Market.

**PV Products GmbH (PVP)** is one out of three module producers, which has the national technical approval of the German approval body Deutsches Institut für Bautechnik (DIBt) for glas-glas-modules (Z-70.3-181). The focus of PV Products GmbH for the future is on Building Integrated Photovoltaic (BIPV) and on special modules for green houses. For the horticultural sector PVP also produces the first 2 times 1.6mm ultrathin glass-glass modules

**PVT-Austria** is the first manufacturer of high quality silicon solar panels in Austria since the year 2001. In 2006 PVT-Austria started its own silicon solar cell production, the first and only one in Austria and produces standard silicon solar cells, coloured silicon solar cells, transparent silicon solar cells and silicon solar cells with asymmetric angles.

**SED Produktions GesmbH** focuses on the production of PV-roof tiles and small size modules for BIPV applications. The custom laminates produced are directly stuck into standard format tiles made of recycled plastic and can easily replace conventional roofing materials. SED also manufactures structures with PV modules and special PV elements for noise barrier walls. The glassless flexible laminates are mounted on aluminium carriers and fit all custom noise barrier types. Most of the modules produced include cells imported from various countries, such as Germany, Spain, the U.S., Taiwan, China and others. Virtually, the whole production is exported.

**Sunplugged GmbH**, based in Tyrol, develops and manufactures flexible photovoltaic modules for the integration into vehicles, devices and building skins. Sunplugged's expertise comprises lightweight PV modules for mobile applications as well as a proprietary flexible thin-film solar cell for building and product integrated photovoltaics.

Since 2013 **MGT-esys**, located in Vorarlberg, is producing tailor made PV modules for BIPV applications.

No production facilities for solar cells existed in Austria in 2013.

Total PV module manufacture together with production capacity information is summarised in Table 10 below.

**Table 10: Production and production capacity information for 2013**

Cell/Module manufacturer (or total national production)	Technology (sc-Si, mc-Si, a-Si, CdTe)	Total Production (MW)		Maximum production capacity (MW/yr)	
		Cell	Module	Cell	Module
<i>Wafer-based PV manufactures</i>					
<b>energetica Energietechnik GmbH</b>	mc-Si / sc-Si		11.0		102.9
<b>SED Produktions GesmbH</b>	mc-Si / sc-Si		0.08		1.0
<b>Others</b>	-		63.395		138.045
Total			74.475		241.945

<b>TOTALS</b>		<b>0</b>	<b>74.475</b>	<b>0</b>	<b>241.945</b>

### 4.3 Manufacturers and suppliers of other components

Besides PV-module production, various other companies are manufacturing components for modules and BOS-components like batteries, inverters, cell wiring or mounting systems.

#### PV Inverters:

Austria has a long tradition as one of the largest inverter producing countries in Europe. **Fronius International** has developed and produced inverters for grid-connected PV systems since 1992. With a current production capacity of approx. 2.2 GW of inverter power, Fronius is among the top inverter manufacturers in the world. The Solar Energy division has sales subsidiaries in 14 countries such as Australia, Germany, Italy, France, Turkey and USA.

In 2013 a total of 470 MW of inverters (rated AC output capacity) were produced. Compared to 2012 with an output of 720 MW and the previous year with an output of 1.0 GW there was reduction in the market. Since the majority of the market for the local producers lies in export (~ 97 %), the global situation of budget cuts carries through to the sales numbers.

#### Balance of System:

Besides inverter manufacturing, Austria hosts some of the largest manufacturers of specialised BOS and other components for the production of PV modules.

**ISOVOLTAIC AG**, headquartered in Lebring/Styria, is the global market and technology leader in the development and production of backsheets for photovoltaic modules. The well-established ICOSOLAR® backsheets and encapsulants provide long-term protection for solar cells and ensure that sunlight can be efficiently converted into energy. The company has more than 25 years of experience in the development and production of high-quality composite protective sheets for solar cells. About 98 % of all production is exported.

**Ulbrich of Austria** is manufacturing string and bus wires for PV cells and modules with a total capacity of more than 2 GW. In 2012 more than 1.2 GW were disposed to European module producers.

**Plansee High Performance Materials** is a subsidiary of the Plansee Group manufacturing refractory metals for diverse applications; more particularly metallic targets for thin film solar cells.

**HEI Eco Technology GmbH** is a leading Austrian Energy Technology Company specialised in developing and manufacturing of solar stand-alone as well as grid-connected LED outdoor lighting systems. The products combine superior design together with innovative technology into a uniform and integrated whole. The company started production in 2007 and is rapidly expanding fabrication facilities. At present, lighting projects are done mainly in Southern Europe, the Middle East and North Africa.

**Lisec Austria GmbH** provides fully automatic production lines for any kind of PV modules based on the Lisec encapsulation technology, which benefits from 50 years of experience in the production of insulating glass. The tempered thin glass used for the glass-glass modules and the additional edge sealing guarantees more robust, absolutely diffusion proof and highly efficient PV-modules.

**Welser Profile** is the leading manufacturer of bespoke profiles made from steel, stainless steel and non-ferrous metals. The Welser Group supplies the photovoltaic industry with products such as support posts, module carrier frames and longitudinal beams. These specially tailored profiles are designed to meet the static loading requirements of PV modules and solar collector frames. Through expert advice and guidance on the right choice of material and cross-section, custom-made solutions are designed and manufactured to provide quick and easy installation.

**Ebner Industrieofenbau** is a leading manufacturer of industrial controlled atmosphere heat treatment furnace facilities. In the area of renewable energy, solutions for the thermal treatment of Thin Film precursors are offered. These applications benefit from the experience Ebner has collected in supplying precision controlled atmosphere furnace technology for the steel, aluminium and copper-base metal industries. The pioneering concepts for the renewable energy applications create new perspectives in offering environmentally friendly and energy efficient high productivity solutions.

**Phoenix Contact**, has many years of experience in overvoltage limiting devices which are produced for the photovoltaics industry.

#### Storage batteries and Battery charge controllers:

**Banner GmbH** is Austria's only battery producer, focussed on automotive batteries, but also producing batteries, which can be used for storage systems for PV.

**neovoltaic AG** is offering battery storage systems for PV from 5 kWh to 20 kWh.

The Tyrolean company **enerChange GmbH** is developing a new generation of storage systems for mobile as well as for stationary purposes. The "changePack" is especially developed for electric vehicles – instead of charging for hours, the batteries can be changed within minutes.

Beside the production of inverters **Fronius International** is developing the world's first TÜV Süd certified hydrogen-powered fuel cell system that generates electricity without any emissions. The Energy Cell converts the energy stored in hydrogen directly into electrical power. For quarter 4/2014 Fronius announced the launch of a battery storage system, consisting of a new hybrid inverter for PV and storage, a solar battery and a Smart Meter.

**Energy 3000 GmbH** is offering battery storage systems for PV and E-mobility.

**Akkutron Handels GmbH** was founded in 2008 as a distributor for battery systems. In 2013 Akkutron started the development of a LiFePO<sub>4</sub>-Battery for customer specific requirements.

**BlueSky Energy Entwicklungs- & Produktions GmbH** produces batteries and storage solutions for micro-grids and renewable energy sources. Together with the strategic partner ViZn Inc. BlueSky is producing innovative zinc iron redox flow batteries.

#### Supporting Structures:

Since 2008, the **Austrian Photovoltaic Technology Platform** brings together industries with a production site in Austria with R&D institutes and universities. The platform is aiming at joint innovation processes as well as improving the frame conditions for the Austrian PV industry development. The University of Applied Sciences Technikum Vienna currently coordinates the platform.

**Austrian Institute of Technology, Energy Department**, is known as internationally accredited PV module test institute for crystalline modules (since 2003) according to the IEC/EN 61215, and for thin film modules, according to the IEC/EN 61646 and module safety qualification according to the

EN 61730. Another industry related activity at the AIT are PV inverters, in particular their performance (MPP, efficiency aspects) and their grid compatibility (Control, Fault-Ride-Through). The AIT PV inverter laboratory attracts worldwide inverter manufacturers for collaboration.

## 5 COMPETITIVENESS OF PV ELECTRICITY

### 5.1 Module prices

Table 11 indicates the typical module prices for the year 2013 as quoted by the Austrian manufacturers and installation companies. Compared to the previous years, module sales price of Austrian manufacturers dropped again in 2013. The average wholesale price of Austrian manufacturers in 2013 was 0.75 EUR/W. The average wholesale-price of Austrian planners was 0.64 EUR/W in the year 2013 (2012: 0.85 EUR/W).

**Table 11: Typical module prices for a number of years**

Year	2010	2011	2012	2013
Standard module wholesale price: manufacturer (sale)	2.0	1.45	0.94	0.75
planner	2.0	1.4	0.85	0.64
Best price manufacturer (sale)	1.75	1.35	0.81	0.65
planner	1.4	0.95	0.63	0.54
PV module price for concentration (if relevant)	N/A	N/A	N/A	N/A

### 5.2 System prices

In 2013, turnkey prices for installed PV systems dropped again compared to the previous years. However, the reduction was small, following the continued high demand of the European PV market and the stringent supply of PV modules on the world market.

In 2013 turnkey prices for typical on-grid systems (5 kWp) varied between a range of 1.65 EUR/W and 2.5 EUR/W, depending on the used PV-technology, the type of the installation and the planning and construction company. The according figures for typical PV applications are shown in Table 12. The considered installations are typical domestic rooftop systems.

Prices for specific building integrated systems are typically considerably higher and depend on the specific case. They are not reported here.

A summary of typical system prices is provided in the following tables.

**Table 12: Turnkey Prices of Typical Applications**

Category/Size	Typical applications and brief details	Current prices per W
OFF-GRID Up to 1 kW	Prices for off-grid systems vary widely (from 3 to 6.5 EUR/W) depending on the application (DC appliances or AC island grid) and the mounting-site.	~ 5 EUR
OFF-GRID >1 kW		
Grid-connected Rooftop up to 10 kW (residential)	5 kWp	1.93 EUR
Grid-connected Rooftop from 10 to 250 kW (commercial)		< 1.55 EUR
Grid-connected Rooftop above 250kW (industrial)		N/A
Grid-connected Ground-mounted above 1 MW		N/A

Other category existing in your country (hybrid diesel-PV, hybrid with battery...)		N/A
--	--	-----

Prices do not include VAT. All figures are estimated based on information provided by installation companies.

**Table 13: National trends in system prices (current) for different applications**

Price/Wp	2007	2008	2009	2010	2011	2012	2013
Residential PV systems < 10 KW	5.400	5.140	4.370	3.680	2.970	2.216	1.934
Commercial and industrial	N/A	N/A	N/A	N/A	N/A	N/A	N/A
Ground-mounted	N/A	N/A	N/A	N/A	N/A	N/A	N/A

### 5.3 Financial Parameters and programs (leasing...)

In 2012 Wien Energie, one of Austria's biggest electric supply companies, started a public participation model for PV in Vienna and Lower Austria, which became very popular especially in urban areas. Private persons have the possibility to buy single PV modules (950 EUR / module) of a solar power plant. After selling all modules successfully, the solar power plant is built and operated by Wien Energie and the private investors will get a 3.1 % revenue every year for leasing their modules to Wien Energie. The minimum contract term is 5 years. At the end of the lifespan of the solar power plant Wien Energie will rebuy the PV modules and the complete amount of the investment will be refunded to the private investors. So far, Wien Energie built 16 solar power plants with a total power of 5 MWp.

A similar public participation model is offered by Energie AG Oberösterreich Fair Energy GmbH in Upper Austria. Private investors will receive an annual remuneration of 3.3 % of their investment. So far, the Energie AG built 10 solar power plants with a total power of 1.2 MWp.

**Table 14: PV financing scheme**

Cost of capital	3.1 % - 3.3 %
PV financing scheme	public participation model for PV

### 5.4 Additional Country information

**Table 15: Country information**

Retail Electricity Prices for an household (range)	0.208 EUR (2013) <sup>4</sup>
Retail Electricity Prices for a commercial company (range)	0.134 EUR (2013)
Retail Electricity Prices for an industrial company (range)	0.134 EUR (2013)

<sup>4</sup> Österreichs Energie, Eurostat (chosen countries), data status 1. halfyear 2013

Population at the end of 2013 (or latest known)	8,504,850 (01.01.2014) <sup>5</sup>
Country size (km <sup>2</sup> )	83,879
Average PV yield (according to the current PV development in the country) in kWh/kWp	950 kWh/kWp to 1.100 kWh/kWp <sup>6</sup>
Name and market share of major electric utilities.	More than 140 electricity provider

<sup>6</sup> Authors estimation

## 6 PV IN THE ECONOMY

### 6.1 LABOUR PLACES

In total it can be estimated that at the end of 2013 approximately 4,843 full-time jobs (2012: 4,850 jobs) were directly linked to PV R&D, manufacturing and installation in Austria. In the various sectors the following figures (Table 16) represent an estimation of existing work places, based on information from the manufacturing companies and R&D institutions.

**Table 16: Estimated PV-related labour places in 2013**

Research and development (not including companies)	107
Manufacturing of products throughout the PV value chain from feedstock to systems, including company R&D	1,402
Distributors of PV products	N/A
System and installation companies	3,334
Electricity utility businesses and government	N/A
Other	
<b>Total</b>	<b>4,843</b>

### 6.2 Business value

In 2013 about 263.1 MWp (2012: 175.7 MWp) of PV systems were installed in Austria which represents an important growth and led to a cumulated total installed capacity of 626 MWp. As a consequence the sum of produced renewable electricity by PV plants in operation amounted to 626 GWh in 2013.

The average specific price of a grid-connected 5 kWp photovoltaic plant in Austria decreased from 2,216 Euro/kWp to 1,934 Euro/kWp, i.e. a reduction of 12.75 %. This observation confirms a high economic learning rate, which is highly correlated to the strongly increasing world market.

Based on this average turnkey price for on-grid connected systems, the estimated value of the national installation market increased to about 510 MEUR (2012: 390 MEUR).

Table 16 provides an overview on the estimated value of PV business in Austria, total export and import of PV products as well as the domestic market.

**Table 16: Value of PV business**

Sub-market	Capacity installed in 2013 (MW)	Price in EUR/ W (from table 12)	Value	Totals
Off-grid domestic	0.468	~ 5.00		2,340,704 EUR
Off-grid non-domestic				
Grid-connected distributed	262.621	1.934		507,908,113 EUR
Grid-connected centralized				
			<b>Total</b>	<b>510,248,817 EUR</b>
<b>Export of PV products</b>				N/A

<b>Change in stocks held</b>	N/A
<b>Import of PV products</b>	N/A
<i>Value of PV business</i>	<b>510,248,817 EUR</b>

In 2013 about 40 % of the Austrian PV module production was exported, compared to almost 70 % in 2012. The export ratio of the Austrian inverter production (97 %) remains high, even if production volumes decrease significantly in 2013. Due to the variety of PV related products manufactured by Austrian industry, no reliable estimation can be provided for the import/export and business value of these products.

Industry value chain:

The following PV value chain gives an overview of the PV industry in Austria. All inputs, products and processes produced or operated by Austrian companies are marked with a red border. Austrian producers can be found in the following areas:

- encapsulants (EVA), all-frames, glass, solders, interconnectors  
e.g. Isovoltaic AG, Ulbrich of Austria, Lisec Austria GmbH
- TCO, metal targets and evaporation sources, organic materials  
e. g. Plansee High Performance Materials
- manufacture module sc, mc, laminate, solder  
e. g. Energetica Energietechnik GmbH, Ertex Solartechnik GmbH, Kioto-Photovoltaic, PV Products GmbH, PVT-Austria, SED Produktions GesmbH, Sunplugged GmbH, MGT-esys
- Balance of system  
e. g. Fronius International, Welser Profile, LEBAU Partnernetzwerk & Bau GmbH, Phoenix Contact, Gebauer & Griller Kabelwerke Gesellschaft m.b.H.

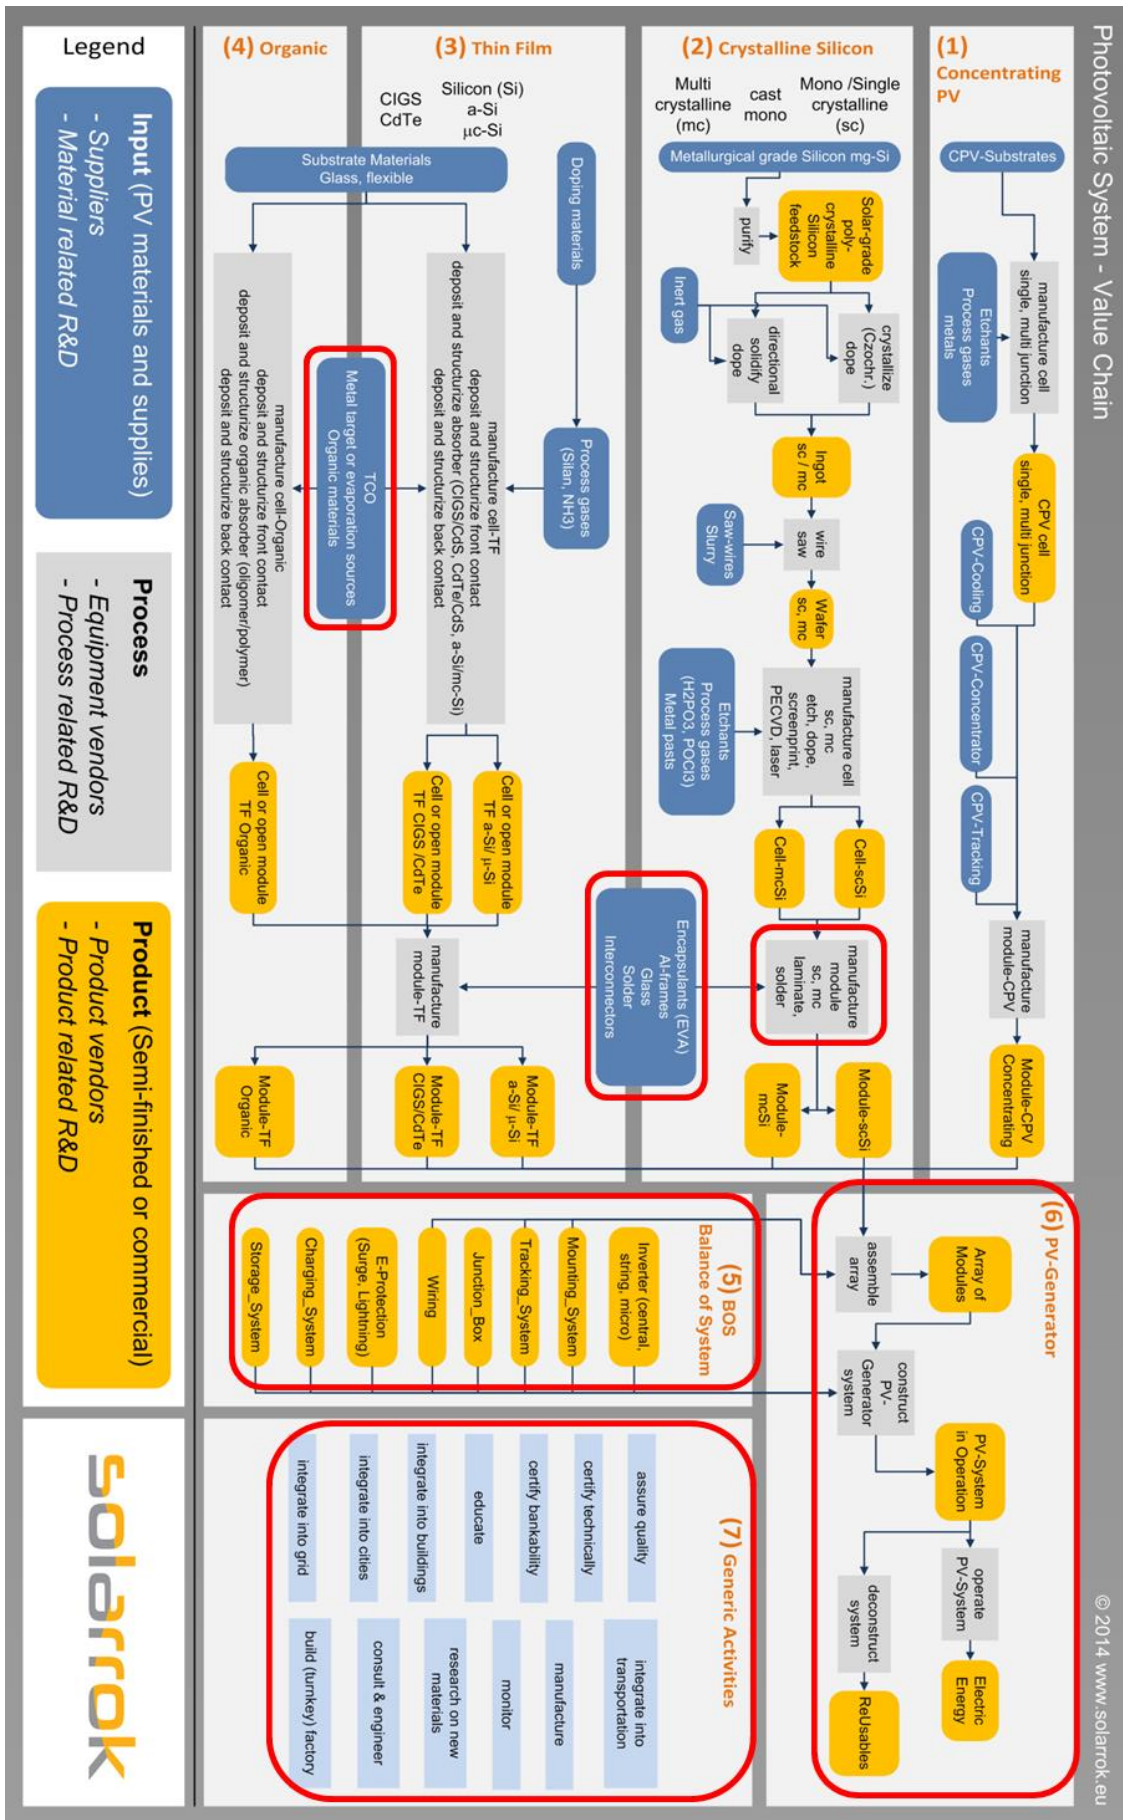

Figure 2: PV value chain for Austria; Data source: SOLARROK 2014

## **7 INTEREST FROM ELECTRICITY STAKEHOLDERS**

### **7.1 Structure of the electricity system**

Since the fully liberalization in 2001 the Austrian electricity market operates within a framework that consists of the relevant legislation at EU (Electricity Directive 2009/72/EC), Austrian (Electricity Act – ELWOG Elektrizitätswirtschafts- und organisationsgesetz) and provincial level (e.g. the Vienna Electricity Act - Wiener Elektrizitätswirtschaftsgesetz).

During the course of the liberalization, a number of great technical and organisational changes resulted for market participants. First of all, the operation of the grids was separated from competitive activities, such as generation, wholesale and retail, which means an unbundling of the vertically integrated electricity utilities in Austria.

Furthermore so-called balance groups were introduced to enable consumers, generators, suppliers and wholesalers to trade or conclude deals with each other. Whoever takes electricity off the grid, feeds in or trades must be member of a balance group.

The E-Control is the politically and financially independent regulator of the Austrian Electricity market. The main tasks are to strengthen competition and ensure that this does not compromise security of supply and sustainability.

At the end of 2013 about 140 distribution system operators (DSO) existed in Austria. These distribution system operators are responsible for secure grid operation, for metering and for handling and processing grid user.

### **7.2 Interest from electricity utility businesses**

In 2013 some Austrian DSOs announced that PV has reached a critical penetration in some network segments. This question of PV grid integration becomes an important national enabler for Smart Grids in Austria.

As already mentioned, some electricity utilities started public participation models for PV.

### **7.3 Interest from municipalities and local governments**

In 2013 almost all provinces offered support in form of investment subsidies in addition to the federal incentives. Burgenland, Salzburg, Styria and Vienna offer a separate support scheme for PV. Other provinces (Carinthia, Lower Austria, Upper Austria, Styria and Salzburg) offer additional funding by the subsidized housing scheme. Only in Vorarlberg and Tyrol no regional support was available in 2013.

## 8 STANDARDS AND CODES

Generally European PV Standards are likewise applied in Austria. Grid-interconnected PV applications are covered in detail by the national standard ÖVE E8001-4-712 published in December 2009 (Formerly ÖNORM/ÖVE E 2750), which defines all safety relevant aspects regarding planning, installation, grid-interconnection, requirements for components and operation of grid connected PV installations.

## 9 HIGHLIGHTS AND PROSPECTS

### Highlights:

In 2013, off-grid and grid connected PV systems with a total PV power of 263,089 kWp have been installed, which led to a cumulated total installed capacity of 625,974 kWp at the end of 2013. For the first time more than 1 % (1.1 %) of the total electricity consumption in Austria was provided by photovoltaic. This is an important step towards the target of the Austrian Photovoltaic Association, who announced 8 % of total electricity by PV to be realistic until 2020, if the support system will become more reliable and some framework conditions will be changed accordingly.

For the first time in recent years the home market became more important for Austrian module manufacturer than the export market. Nevertheless the international PV market will remain the basis for growth and will help to strengthen the position of Austria as an important supplier of components for PV systems.

The annual National Photovoltaic Conference 2013 (a two day event), organised by some of the main PV stakeholders and supported by the Ministry of Transport, Innovation and Technology, was once again a great success, with more than 350 experts participating. This conference is established as THE annual come together of the Austrian PV stakeholders.

### Prospects:

Austrian photovoltaic R&D is conducted in thin layer technology, grid integration and building integration. Especially the development of building integrated photovoltaic elements is of high importance and can represent a very attractive market segment for future development of the Austrian photovoltaic industry. High added value seems to be achievable in this market branch. In this context the OFI together with 8 partners started the project „PV@Fassade - Fassadenelement mit PV-aktiven Schichten“ in spring 2014. This project, sponsored by the Austrian Climate and Energy Fund, is dealing with the integration of PV in facades.

To strengthen the competitiveness and expand the value creation for the Austrian market the Technology Platform Photovoltaic (TPPV) was founded in 2009 by companies involved in the PV production of PV components.

Furthermore, due to the increased deployment of PV-systems, the question of PV grid integration becomes an important national enabler for Smart Grids.

## Definitions, Symbols and Abbreviations

For the purposes of this and all IEA PVPS National Survey Reports, the following definitions apply:

PV power system market: The market for all nationally installed (terrestrial) PV applications with a PV power capacity of 40 W or more.

Installed PV power: Power delivered by a PV module or a PV array under standard test conditions (STC) – irradiance of 1 000 W/m<sup>2</sup>, cell junction temperature of 25°C, AM 1,5 solar spectrum – (also see ‘Rated power’).

Rated power: Amount of power produced by a PV module or array under STC, written as W.

PV system: Set of interconnected elements such as PV modules, inverters that convert d.c. current of the modules into a.c. current, storage batteries and all installation and control components with a PV power capacity of 40 W or more.

CPV: Concentrating PV

Hybrid system: A system combining PV generation with another generation source, such as diesel, hydro, wind.

Module manufacturer: An organisation carrying out the encapsulation in the process of the production of PV modules.

Off-grid domestic PV power system: System installed to provide power mainly to a household or village not connected to the (main) utility grid(s). Often a means to store electricity is used (most commonly lead-acid batteries). Also referred to as ‘stand-alone PV power system’. Can also provide power to domestic and community users (plus some other applications) via a ‘mini-grid’, often as a hybrid with another source of power.

Off-grid non-domestic PV power system: System used for a variety of industrial and agricultural applications such as water pumping, remote communications, telecommunication relays, safety and protection devices, etc. that are not connected to the utility grid. Usually a means to store electricity is used. Also referred to as ‘stand-alone PV power system’.

Grid-connected distributed PV power system: System installed to provide power to a grid-connected customer or directly to the electricity grid (specifically where that part of the electricity grid is configured to supply power to a number of customers rather than to provide a bulk transport function). Such systems may be on or integrated into the customer’s premises often on the demand side of the electricity meter, on public and commercial buildings, or simply in the built environment on motorway sound barriers etc. They may be specifically designed for support of the utility distribution grid. Size is not a determining feature – while a 1 MW PV system on a rooftop may be large by PV standards, this is not the case for other forms of distributed generation.

Grid-connected centralized PV power system: Power production system performing the function of a centralized power station. The power supplied by such a system is not associated with a particular electricity customer, and the system is not located to specifically perform functions on the electricity grid other than the supply of bulk power. Typically ground mounted and functioning independently of any nearby development.

Turnkey price: Price of an installed PV system excluding VAT/TVA/sales taxes, operation and maintenance costs but including installation costs. For an off-grid PV system, the prices associated with storage battery maintenance/replacement are excluded. If additional costs are incurred for

reasons not directly related to the PV system, these should be excluded. (E.g. If extra costs are incurred fitting PV modules to a factory roof because special precautions are required to avoid disrupting production, these extra costs should not be included. Equally the additional transport costs of installing a telecommunication system in a remote area are excluded).

Field Test Programme: A programme to test the performance of PV systems/components in real conditions.

Demonstration Programme: A programme to demonstrate the operation of PV systems and their application to potential users/owners.

Market deployment initiative: Initiatives to encourage the market deployment of PV through the use of market instruments such as green pricing, rate based incentives etc. These may be implemented by government, the finance industry, electricity utility businesses etc.

Final annual yield: Total PV energy delivered to the load during the year per kW of power installed.

Performance ratio: Ratio of the final annual (monthly, daily) yield to the reference annual (monthly, daily) yield, where the reference annual (monthly, daily) yield is the theoretical annual (monthly, daily) available energy per kW of installed PV power.

Currency: The currency unit used throughout this report is Euro.

PV support measures:

Feed-in tariff	an explicit monetary reward is provided for producing PV electricity; paid (usually by the electricity utility business) at a rate per kWh that may be higher or lower than the retail electricity rates being paid by the customer
Capital subsidies	direct financial subsidies aimed at tackling the up-front cost barrier, either for specific equipment or total installed PV system cost
Green electricity schemes	allows customers to purchase green electricity based on renewable energy from the electricity utility business, usually at a premium price
PV-specific green electricity schemes	allows customers to purchase green electricity based on PV electricity from the electricity utility business, usually at a premium price
Renewable portfolio standards (RPS)	a mandated requirement that the electricity utility business (often the electricity retailer) source a portion of their electricity supplies from renewable energies
PV requirement in RPS	a mandated requirement that a portion of the RPS be met by PV electricity supplies (often called a set-aside)
Investment funds for PV	share offerings in private PV investment funds plus other schemes that focus on wealth creation and business success using PV as a vehicle to achieve these ends
Income tax credits	allows some or all expenses associated with PV installation to be deducted from taxable income streams

<p>Compensation schemes (self-consumption, net-metering, net-billing...)</p>	<p>These schemes allow consumers to reduce their electricity bill thanks to PV production valuation. The schemes must be detailed in order to better understand if we are facing self-consumption schemes (electricity consumed in real-time is not accounted and not invoiced) or net-billing schemes (the electricity taken from the grid and the electricity fed into the grid are tracked separately, and the electricity account is reconciled over a billing cycle). The compensation for both the electricity self-consumed and injected into the grid should be detailed. Net-metering schemes are specific since they allows PV customers to incur a zero charge when their electricity consumption is exactly balanced by their PV generation, while being charged the applicable retail tariff when their consumption exceeds generation and receiving some remuneration for excess electricity exported to the grid</p>
<p>Commercial bank activities</p>	<p>includes activities such as preferential home mortgage terms for houses including PV systems and preferential green loans for the installation of PV systems</p>
<p>Activities of electricity utility businesses</p>	<p>includes 'green power' schemes allowing customers to purchase green electricity, operation of large-scale (utility-scale) PV plants, various PV ownership and financing options with select customers and PV electricity power purchase models</p>
<p>Sustainable building requirements</p>	<p>includes requirements on new building developments (residential and commercial) and also in some cases on properties for sale, where the PV may be included as one option for reducing the building's energy foot print or may be specifically mandated as an inclusion in the building development</p>
